Appl. No. 10/554,005 Amdt. dated February 12, 2010

Reply to Office action of August 11, 2009

In the Claims:

No claim is amended.

- 1. (canceled)
- 2. (previously presented) The method according to claim 4, characterized in that at the start-up alkyl benzene and/or the gasoline fraction having a boiling temperature below 220°C is used as an organic solvent.
- 3. (previously presented) The method according to claim 4, characterized in that a part of the liquid fraction, as subjected to catalytic reforming, with the boiling temperature below 220°C is returned for thermal liquefaction of a new batch of wastes at a pressure in the range from at least 2.9 MPa to not more than 5 MPa, the solvent-waste weight ratio being in the range from more than 1.0 to not more than 3.0.
- 4. (previously presented) A method for recycling rubbercontaining wastes, including thermal liquefaction of wastes fed
 into a reactor containing an organic solvent at a temperature
 above 270°C and a pressure up to 6 MPa, separation of the liquid
 fraction from the undissolved product, distillation of the liquid
 fraction into the fraction with the boiling temperature below
 220°C and the fraction with the boiling temperature above 220°C,
 characterized in that the process of thermal liquefaction and

Appl. No. 10/554,005

thermolysis is carried out in a fluid bed of the solvent at the organic solvent-waste weight ratio being more than 1.0, the liquid fraction with the boiling temperature below 220°C is subjected to catalytic reforming, a part of the said liquid fraction is used as the target product, and the remaining part of the said fraction is used as a solvent and returned for thermal liquefaction of a new batch of wastes, further all the said process is repeated for many times.
